bulletProofPenguin.md 2024-06-03

# **Bullet Proof Penguin**

You have been hired by the XYZ company as a consultant to harden the Bulletproof Penguin, an old server that's never been hacked (as far as we know). As you arrive, the company's IT crew hands you a vulnerability scan report that was recently made against the server, and asks you to implement solutions to each finding.

### Redis Server with no Password

The remote Redis server is not protected with a password. This issue may be exploited by a remote attacker to gain access to sensitive information or modify system configuration.

Configuring the password can be done by editing the redis.conf file

requirepass myStrongPassword123!

## Simple Network Management Protocol(SNMP)

Simple Network Management Protocol (SNMP) is a protocol which can be used by administrators to remotely manage a computer or network device.

Changes can be done through the

/etc/snmp/snmpd.conf

```
# rocommunity: a SMMPv1/SMMPv2c read-only access community name
# arguments: community (default|Nostname.network/bits] [oid | -V view]
# Read-only access to everyone to the systemonly view
rocommunity notpublic default -V systemonly
rocommunity notpublic default -V systemonly
# SMMPv2 doesn't use communities, but users with (optionally) an a leastion hosted by nginx.
# authentication and encryption string. This user needs to be created
# with what they can view with rouser/conservations in this file.
```

### **Nginx**

It is a web server that can also be used as a reverse proxy, load balancer, mail proxy and HTTP cache.

In this case it is running as root, this can be exploited and allow the user to gain root privileges.

```
thodip-10-16-57-23:4-/enc/encist systemctl status mginx 'e nginx me'us - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 - 0.16 -
```

We can now check the processes to which the permissions

```
Tool 561 1 0 1840 2160 0 17:18 tty50 00:00:00 /sbin/agetty -o -p - \u --keep-baud 115:00,38400,9600 tty50 vt220

root 566 1 0 1459 1748 1 17:18 tty1 00:00:00 /sbin/agetty -o -p - \u --noclear tty1 line
root 612 1 0 12804 1448 1 17:18 7 00:00:00 mglnx: master process /usr/sbin/nginx -g daemon on; master_process on;

root 613 612 0 12945 2560 0 17:18 ? 00:00:00 mglnx: master process /usr/sbin/nginx -g daemon on; master_process on;

root 726 1 0 54612 12160 0 17:18 ? 00:00:00 mglnx: morker process

root 726 1 0 54612 12160 0 17:18 ? 00:00:00 /usr/sbin/ngante2 -k start
```

We need to change the account running the nginx service

/etc/nginx/nginx.conf

bulletProofPenguin.md 2024-06-03

sudo systemctl restart nginx

### Clear Text Protocols

The remote host is running a Telnet service that allows cleartext logins over unencrypted connections. An attacker can uncover login names and passwords by sniffing traffic to the Telnet service.

We need to diable telnet and TFTP(port 69)

sudo nano /etc/inetd.conf

We need to hash out the telnet and TFTP lines

Unistalling telent

```
sudo dpkg -l | grep telnet - checking if its installed
sudo apt-get purge telnet - unistalling telnet client
sudo apt-get purge telnetd - unistalling telnet server

sudo apt-get autoremove
sudo apt-get autoclean
```

sudo systemctl restart inetd

## Weak SSH Keys

SSH is secure as compared to its counter-part telnet

- The remote SSH server is configured to allow / support weak key exchange (KEX) algorithm(s). An attacker can quickly break individual connections.
- The remote SSH server is configured to allow / support weak encryption algorithm(s).
- The remote SSH server is configured to allow / support weak MAC algorithm(s).

We can edit the ssh config file

/etc/ssh/sshd\_config

### Anonymous FTP Login

A host that provides an FTP service may additionally provide Anonymous FTP access as well. Under this arrangement, users do not strictly need an account on the host. Instead, the user typically enters 'anonymous' or 'ftp' when prompted for username. Although users are commonly asked to send their email address as their password, little to no verification is actually performed on the supplied data.

sudo nano /etc/vsftpd.conf

Here you change the anonymous login to NO

systemctl restart vsftpd.service

#### Weak Passwords

bulletProofPenguin.md 2024-06-03

Strong passwords are key for security.

changing password for an account

sudo passwd username

deleting an account

sudo userdel -r username #-f to force issues

### **Sudo Permissions**

Ensure that permissions to execute elevated commands via sudo are granted only to users that strictly require it.

sudo -l

nano /etc/sudoers

To allow the user mary to run the /usr/bin/ss command as root without being prompted for a password, you need to edit the sudoers file.
mary ALL=(ALL) NOPASSWD: /usr/bin/ss

```
# Members of the admin group may gain root privileges

Radmin Alt=(ALL) ALL

# munra ALL=(ALL:ALL) ALL

# munra ALL=(ALL:ALL) ALL

# secunders(s) for more information on "#include" directives:

##includedir /etc/sudoers.d

mary ALL=(ALL) NOPASSMO: /usr/bin/ss
```

## **Exposed Database Ports**

While not a vulnerability in itself, exposing database ports makes them prone to brute-force attacks and other exploits. Ensure that access to the reported database ports is restricted to the minimum necessary.

sudo nano /etc/mysql/mysql.conf.d/mysqld.cnf

sudo systemctl restart mysql

```
# Instead of skip-networking the default is now to listen only online to bind port 6379 to 127.00.1 (ocalhos) only.
# Tocalhost which is more compatible and is not less secure.
bind-address = 127.0.0.1
# # Fine Tuning # Tocalhost the Questions below
# # Fine Tuning # Tocalhost the Questions below
```

sudo nano /etc/redis/redis.conf
